Alarm Monitoring Services

The 6139 AV Keypad includes all of the features of our popular 6139 Keypad plus audio verification. When an alarm occurs, audio verification allows direct communication between the central station and the premises by a telephone connection through the keypad. In trouble conditions, the central station will be able to verify that there actually is an alarm condition, and can dispatch assistance immediately. Audio verification also reduces unnecessary dispatches caused by false alarms. This unique feature is activated by using the optional VIM Module and VISTA-40 Control Panel.

Everything in plain English.

A sophisticated and versatile keypad, the 6139 AV is very simple to operate. It has a large, two-line, 32 character, backlit customized English language display. Warnings and zone messages are indicated clearly. There are no confusing blinking lights.

Customized for your needs

Each protection zone is custom-programmed into the control and identified by name to eliminate confusion. You are instantly aware of the status of your security system.

ADEMCO

6139 AV Keypad

Keypad Features

- ▲ Audio verification of an alarm condition
- ▲ Attractively designed keypad with removable door
- ▲ Easy-touch plastic white keys that are backlit for easy visibility
